

10 Reasons Why Kim Document:

Kim transforms Microsoft Word into the world's easiest-to-use document automation, data capture and systems integration platform.

1. Quick to onboard

Kim uses universal tools such as MS Word, MS Teams and your browser, meaning teams can get started quickly without requiring extensive training or a steep learning curve.

2. Easy to adopt

Kim turns an organization's existing documents - letters, forms, records, checklists, and contracts you've already invested in - into web applications, which is the gateway to enabling people to input the data that generates documents and allows the flow of data to multiple systems.

3. Standardization of data capture

Kim ensures data is captured in a structured manner using web forms. Given the rise in private large language models (LLMs), structured data is one of the critical elements to train these models as it's easier to curate, clean and preprocess.

4. Creates standard operating procedures

Kim enables you to create standard operating procedures (SOPs) from your existing documents, helping to ensure everyone on your team follows the same processes and procedures, reducing errors and improving consistency.

5. Extensive API integration

Kim's open API allows for easy integration with your existing technology stack, including popular tools like Salesforce, Workday, DocuSign, monday.com and SharePoint, making incorporating Kim into your existing workflows and processes easy.

6. Drives straight-through processing of data

Kim helps you to streamline your data processing by automating repetitive tasks. You can capture relevant data via web forms and then push and pull that data into and out of multiple systems or automatically generate single documents or suites of documents using the data.

7. No error-ridden rekeying required

IBM's research highlights a substantial annual cost of \$3.1 trillion for US businesses due to manual data rekeying. Kim eliminates the need to rekey data, reducing errors, enhancing data accuracy, enabling efficient data utilization, and supporting data-driven decisions.

8. No-Code solution

Kim is a no-code solution, eliminating the need to rely on developers for your automation projects. This empowers both technical and business users, with minimal or no training required, to independently automate their documents.

9. Only pay for the automators

The cost and implementation challenges have limited the broad adoption of document automation solutions. Yet, with Kim, you pay solely for the automators, presenting a highly cost-effective option.

10. Scalable to a global enterprise level (start small & scale)

Kim is scalable to a global enterprise level, so you can start small and scale up as needed. Whether you're a small startup or a large enterprise, Kim Document can help you.
